**Marvelous stone company** with many years of experience is an expert in the field of exporting different varieties of marble, granite, travertine, onyx, and basalt in Iran and around the globe.

The company export and supplies varieties types of building stones as per orders with the best quality. The most strong stones and unique appearance.

The company is currently in cooperation with a number of mines and stone distribution factories in Iran to provide the best range of stones to customers. So far, the company has a great career to provide stone for residential, official, commercial, and health care projects.

Marvelous stone company is passionately following it is goals and missions to become the number one and the largest stone exporter in the Middle East in just a few coming years.

**Marble** is a type of metamorphic rock based on calcium carbonate, which is recrystallized from calcite, dolomite and crystal over time, under high pressure and heat, and its structure is transformed into large, streaked calcite.

The minerals that make up most of the marble are calcite, and other minerals such as quartz, hematite, limonite, and so on.

Marble also has a series of stainless steel chains that look like a ribbon in the texture of stone.

It is a unique appearance, which includes waves with different designs and sometimes in various and beautiful colors, make it a suitable option for many uses and satisfies different tastes according to its wide range.

# MARVELOUS STONE COMPANY

**Travertine** is a calcareous rock formed by the activity of hot springs and the rapid cooling of water. The travertine stone has a porous texture and is layered. This stone can be cut in two ways: vein cut and cross-cut.

Most travertine stone have the low abrasion resistance and good compressive strength. high compressive strength and high porosity provide the conditions for installing travertine stone at height. Travertine has high polishing and luminous properties and its color is stable against sunlight. The characteristics of travertine stone include a variety of colors, lightweight, excellent subsoil ability, good compressive strength, constant colors,

## MARVELOUS STONE COMPANY

It is one of the metamorphic rocks that has been formed from the metamorphism of limestone.

Its main mineral is calcite. This stone has been widely used for sculpture.

The view of the Taj Mahal in India is from **Onyx**. This stone has also been used in pilgrimage buildings and the shrines of Imams.

One of the most important features of this stone is the passage of light through this stone.

# MARVELOUS STONE COMPANY

**Granite** is formed by the cooling of molten masses. Granite is a symbol of toughness, strength, and durability. the main minerals are feldspar, quartz, mica, and other minerals.

Granite has a uniform texture in appearance and is mostly found in gray, red, pink, green, and black. Granite has very low porosity and has good heat resistance.

Granite highly abrasion resistant and therefore has good polish and luster. it is very durable in busy places. Granite has high compressive strength and is therefore used in paving high-pressure areas.

Granite stones are characterized by high compressive strength and abrasion resistance and low water absorption

# Shipment

Based on the standard size of each stone slab which is  $180 \times 300$  with a thickness of 2-3 cm and weight of 30 tons, it is loading in a heavy 40-foot container. In case the container is a small 20-foot, hence only 25 tons of cargo would be loaded.

However, the great point is that our company is providing other sizes for slabs, such as  $180 \times 150$  cm and  $130 \times 130$  cm, in which loading capacity would be definitely different.
